

- Title style: **assertion only**. Write the headline as if it were a text message.

Sketch it. This figure is mostly typography — a big number and a short sentence. Don't draw a full chart unless you need one.

Headline (≤ 8 words): _____

Annotation move you'd use (e.g., `theme_void()` + `annotate("text")` for big number, `annotate("segment")` for a decorative underline, `dark plot.background()`):

Step 4: Compare the two versions

Question	Version A (professor)	Version B (roommate)
What's dropped from the data?		
What's emphasized?		
Is the title a description or an assertion?		
Could it mislead? How?		

The honest-framing question: Version B drops a lot of detail. Is it still **honest**? Why or why not? _____

Step 5: Skeleton code

Fill in the blanks for **Version B** (the social-card style). You don't need real data — `ggplot()` can draw a canvas with no data at all.

```
ggplot() +
  annotate("text", x = 0.5, y = 0.7,
    label = "_____", # the big number
    size = 38, fontface = "bold",
    color = "_____" ) + # text color
  annotate("text", x = 0.5, y = 0.4,
    label = "_____", # your headline ( $\leq 8$  words)
    size = 5, color = "white") +
  xlim(0, 1) + ylim(0, 1) +
  coord_fixed() +
  theme_____() + # which theme strips everything?
  theme(plot.background = element_rect(fill = "_____"))
```

Check your work

Trade handouts with your partner. For each version, ask:

- Could a reader from that audience tell what the finding is in **5 seconds**?
- Is the title doing the work, or is the chart doing the work? (Both should align.)
- What annotation from today shows up in each sketch?
