

Session 18: Putting It All Together — Pen-and-Paper Pair Exercise

PSY 410 | Data Science for Psychology

Name: _____ Date: _____

No laptop today? No problem. Work with a partner who has a laptop and compare your work at the end.

The task: Debug this code

This code has several errors. Find and fix them all.

```
library(tidyverse)

Study_data <- tibble(
  id = 1:5,
  Score = c(10, 15, 12, 18, 14),
  Group = c("A", "B", "A", "B", "A")
)

study_data |>
  filter(Group = "A") |>
  summarize(
    mean_score = mean(score)
    sd_score = sd(score)
  )
```

Hint: There are at least 4 bugs. Check names (capitalization), operators (= vs ==), and punctuation.

Step 1: Mark up the code above

Circle each error in the code block. Cross it out and write the fix above or below it.

Step 2: List the bugs

#	Line	What's wrong	How to fix it
1			
2			
3			
4			

Step 3: Which error would R show *first*?

R stops at the first error and doesn't report the rest. Which bug do you think R would catch first when you run this code? Why?

Check your work

Compare your bug list with your partner's screen. Did you find all 4?

If your partner ran the corrected code, what did `summarize()` return for Group A?

`mean_score` = _____ `sd_score` = _____

Did R catch the bug you predicted first? (circle one) **Yes** / **No** — actual first error:
